

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

## Supplementary Materials

These scripts and subsequent updates will be hosted on Github (<https://github.com/ATStahl/CBEM> ). All lines without black background in JavaScript can be copied and pasted directly in the Earth Engine Code Editor (<https://code.earthengine.google.com/> )

### Script 1: Inspect imagery, classify cover, and evaluate accuracy

This script executes the following tasks as implemented in the study area, eastern Washington State, USA.

- I. Search for all available Sentinel-2 satellite imagery in the study area over the time period of interest.
- II. Create an average (median) composite image for each specified time interval, discarding the cloudiest images and replacing any remaining cloudy pixels with pixels from another date.
- III. Compute indices of vegetation vigor from the composite images.
- IV. Build and train a model to classify land cover with selected spectral bands and indices from the composite images.
- V. Apply the model to classify land cover in other areas or timeframes (compared to the image that was used to train the model).
- VI. Evaluate the accuracy of the model with an independent set of validation polygons.

Annotations above each block of code indicate what those lines accomplish and how they can be adapted to different study areas or timeframes. Note that “//” marks text that will be disregarded by GEE, so those lines can be copied directly into the Code Editor for quick reference. In some instances, “//” are used to prevent lines of code from being executed during a given model run. This helps to manage performance and keep each run of the script within the memory limitations of GEE. (Comment lines will be shown in green text in the Code Editor).

```
// The purpose of this script is to create a cloud-free
// Sentinel-2 satellite composite image for the study area.
// It averages spectral data over the time interval of interest:
// 15 August to 1 October 2018.
// It then builds a model using spectral bands B4 and B11 combined with two
// indices of vegetation vigor (NDVI and NDRE) from the input image.
// The user draws and labels polygons to indicate 4 cover classes: impervious
// surfaces, water, brown vegetation, green vegetation.
// The labeled polygons are input into a Random Forest classifier with 100 trees.
// The classifier is then applied to classify each of the late season
// (15 August to 1 October) composite images: 2016, 2017, 2018, 2019
// The user draws and labels validation polygons with the 4 cover classes on
// one of the classified images (other than the input image). These are
// input for the confusion matrix, used to evaluate accuracy
// Finally, it exports classified late season composite images to Assets or
// Google Drive for subsequent analysis.
```

```
43
44  /****NOTE: Some lines are commented out with " //" so that they will not use
45      // computing power unless needed in the current run. The user can then
46      // choose which lines to activate for each run for efficiency in producing
47      // desired outputs.
```

```
48
49  "Assets" provide a way of importing GIS files that were created outside of GEE. They also enable the user to save
50  outputs from a previous run of the script so that they can be imported back into the script for quick analysis with
51  minimal memory usage. The comment lines below are simply a note to indicate that some of the objects used in
52  this script are stored as Assets, either before any lines are executed (e.g., the study area outline) or during the
53  execution of the script (e.g., hand-drawn polygons and classified image composites).
```

```
54
55  // Imported assets that accompany this script will include training polygons,
56      // classified image composites (after classification step has run),
57      // and polygons for validation.
```

```
58
59  Below we have added two lines of code to create a simple rectangular polygon outlining the study area for this
60  script. It covers the area analyzed by Stahl et al. 2021. (The shapefile for that study area is available on Github).
61  If you wish to analyze a different area, you have three options.
62      (1) Enter bounding coordinates (longitude, latitude in decimal degrees) to outline a study area anywhere
63          on the globe.
64      (2) Draw a polygon or rectangle on the map. Exit drawing, then hover over the geometry layer to open
65          the geometry settings, rename it "ROI" and choose to import it as a FeatureCollection.
66      (3) If you have a shapefile for your study area, you can import it as an Asset (upload the 6 files that
67          comprise the shapefile, leaving out the ".sbx" if there is one. Alternatively, you can upload a single zip
68          file containing the 6 files in the shapefile). After it has been ingested (check Task pane for progress),
69          import the Asset into this script, and then assign it to a variable by clicking "table" and replacing it
70          with "ROI" – those steps will change the study area in this script.
```

```
71
72  Note that a larger study area may take longer to process requests.
```

```
73
74  /****Set the boundaries of the area for image querying and analysis***/
75      // If changing to another study area with option (2) or (3) above, delete or
76      // comment out the following two lines of code (lines 78-85).
77      var studyAreaGeometry = ee.Geometry.Polygon([
78          [[-119.1098, 47.7328],
79          [-115.5251, 47.7328],
80          [-115.5251, 45.3685],
81          [-119.1098, 45.3685]]
82      ]);
83
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
84     var ROI = ee.FeatureCollection(studyAreaGeometry);
```

```
85
```

86 In this script, we will apply a function to mask clouds each time we create a composite image. The cloud mask  
87 function in the lines below is written near the top of the script so that it will be available when called later on.  
88 Sentinel imagery has a band labeled 'QA' that indicates cloud cover; that is what is used here. Other image sources  
89 such as Landsat imagery have searchable code snippets to deal with clouds.

```
90
```

```
91
```

```
92 // Function to mask clouds using the Sentinel-2 QA band.
```

```
93 function maskS2clouds(image) {
```

```
94     var qa = image.select('QA60');
```

```
95     // Bits 10 and 11 are clouds and cirrus, respectively.
```

```
96     var cloudBitMask = 1 << 10;
```

```
97     var cirrusBitMask = 1 << 11;
```

```
98     // Both flags should be set to zero, indicating clear conditions.
```

```
99     var mask = qa.bitwiseAnd(cloudBitMask).eq(0).and(
```

```
100         qa.bitwiseAnd(cirrusBitMask).eq(0));
```

```
101     // Return the masked and scaled data, without the QA bands.
```

```
102     return image.updateMask(mask).divide(10000)
```

```
103         .select("B.*")
```

```
104         .copyProperties(image, ["system:time_start"]);
```

```
105 } //be sure to include the closing bracket to this function
```

```
106
```

```
107
```

108 The following lines are used to query the Sentinel-2 image collection. Because the study area is semi-arid and the  
109 time interval was during the dry season, we were able to reliably use the top of atmosphere (Level 1C) product.  
110 Sentinel-2 imagery pre-processed for surface reflectance (Level-2A) is becoming available on GEE and may be  
111 more appropriate to use in some settings. First, we will query and create composite image to train the classifier.  
112 Then we will repeat the same process to query and composite an image to classify.

```
113
```

```
114 /***Query Sentinel-2 image collection***/
```

```
115
```

```
116 // * Training image *
```

```
117 // Create a variable to store the training image collection overlapping the
```

```
118     // study area (ROI), filtered to the time period of interest
```

```
119     var trainingCollection = ee.ImageCollection('COPERNICUS/S2')
```

```
120         .filter(ee.Filter.bounds(ROI))
```

```
121         .filterDate('2018-08-15', '2018-10-01')
```

```
122
```

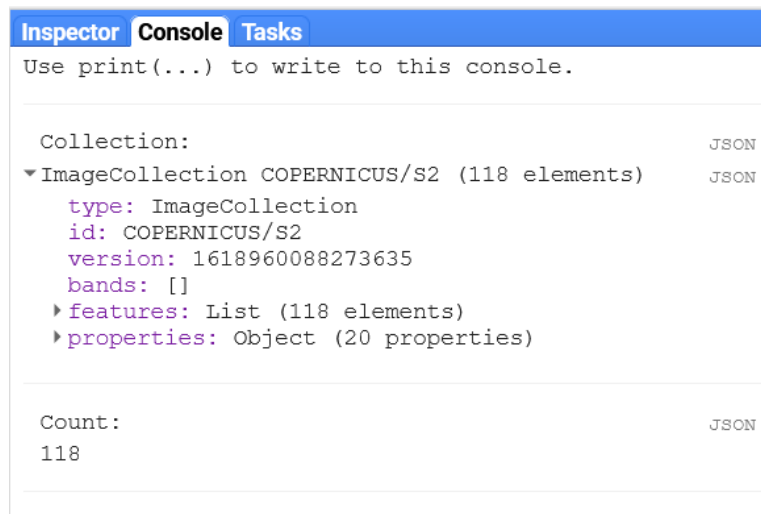

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
123 // Pre-filter to get fewer cloudy granules (here, < 20% cloud cover –
124 // you can change to other thresholds if needed, e.g. 50 or 60 for a
125 // frequently cloudy area)
126 .filter(ee.Filter.lt('CLOUDY_PIXEL_PERCENTAGE', 20))
127
128 // Apply the cloud mask
129 .map(maskS2clouds); // (the line of code ends here with semicolon)
130
131 // Average the images by taking the median value of each pixel to create a
132 // single composite image.
133 var trainingMedian = trainingCollection.median();
134
135 // Clip the composite image to the study area outline (ROI)
136 var trainingImage = trainingMedian.clipToCollection(ROI);
137
138
139 // * Image to be classified *
140 // Create a variable to store the training image collection overlapping the
141 // study area (ROI), filtered to the time period of interest (change dates
142 // in lines below as needed)
143 var classifyCollection = ee.ImageCollection('COPERNICUS/S2')
144 .filter(ee.Filter.bounds(ROI))
145 .filterDate('2019-08-15', '2019-10-01') //change dates in parentheses
146 // as desired
147
148 // Pre-filter to get less cloudy granules. Use the same cloud threshold as for
149 // training image above (here it's set to 20).
150 .filter(ee.Filter.lt('CLOUDY_PIXEL_PERCENTAGE', 20))
151 .map(maskS2clouds);
152
153 // Average the images by taking the median value of each pixel to create a
154 // single composite image.
155 var classifyMedian = classifyCollection.median();
156
157 // Clip the composite image to the study area outline (ROI)
158 var classifyImage = classifyMedian.clipToCollection(ROI);
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
159
160
161 //To view information about available imagery (replace "classifyCollection"
162 // below with "trainingCollection" or another image collection variable
163 // to get information about it.
164 print('Collection: ', classifyCollection); //comment this line out after
165 //you have the information so it does not use memory in subsequent runs.
166
167
168 //Get the number of images. Replace "classifyCollection" with another image
169 // collection variable to get information about it.
170 var count = classifyCollection.size();
171 print('Count: ', count); //comment this line out after you have the
172 // information so it does not use memory in subsequent runs.
173
```

174 Pause here. Copy all code lines above this point and paste them into the Code Editor. Save the script with a name  
175 of your choosing and click Run. In the Console, you will see information appear about the Image Collection and  
176 the number of images found in the query (see example in image below). Once you have viewed the information,  
177 you can choose to comment out these "print" lines to save memory on subsequent runs.

178  
179  
180 Next, we demonstrate how to compute vegetation indices. Here we compute the Normalized Difference  
181 Vegetation Index (NDVI) and the Normalized Difference Red Edge Index (NDRE). We then add them as bands to  
182 the images that will be trained and classified so they can be included in the random forest classification.

```
183
184 /***Compute NDVI and NDRE and add as bands to median composite images.***/
185 /*Use the normalizedDifference(A, B) to compute (A - B) / (A + B) for each
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

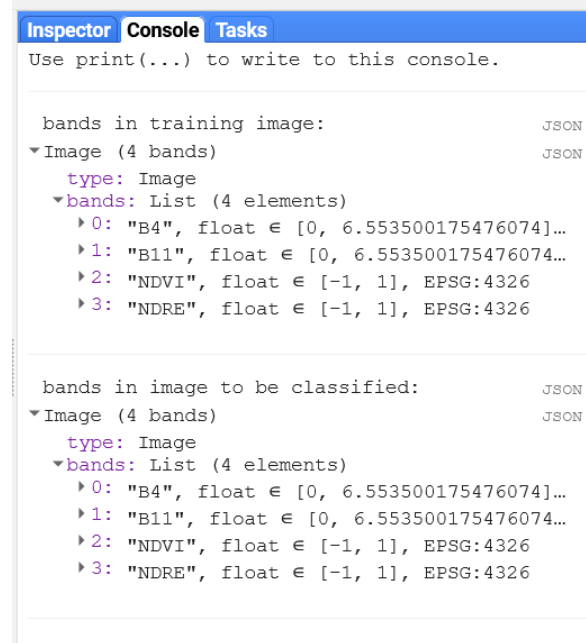

```
186 // index. We create a function to do this so it can be repeated as needed
187 // for subsequent images.
188
189 var addNDRE = function(image) {
190     var ndre = image.normalizedDifference(['B8', 'B5']).rename('NDRE');
191     return image.addBands(ndre);
192 };
193
194 var addNDVI = function(image) {
195     var ndvi = image.normalizedDifference(['B8', 'B4']).rename('NDVI');
196     return image.addBands(ndvi);
197 };
198
199 /**Add NDVI and NDRE bands to image composites that will be used for
200     // training and classification.
201 var ndre_train = addNDRE(trainingImage).select('NDRE');
202 var ndvi_train = addNDVI(trainingImage).select('NDVI');
203 var ndre_classify = addNDRE(classifyImage).select('NDRE');
204 var ndvi_classify = addNDVI(classifyImage).select('NDVI');
205 var indexParam = {min: -1, max: 1, palette: ['black', 'white']};
206
207 /**Set the map center location and zoom level, then add map layers.**
208 // Notes: You can use the Inspector to find coordinates and zoom level on the
209 // map. In the lines below, "false" indicates that the map layer will not
210 // be displayed by default (in Layers, the box will be unchecked), which
211 // saves loading time. Image visualization parameters can be manually
212 // adjusted and imported as a variable for subsequent script runs. To do
213 // this, hover over the layer on the map and click the settings symbol.
214
215 // Here, we add true color and color infrared layers for the training image,
216 // as well as the vegetation indices for both training and classification
217 // images. One could similarly display the true color and color infrared
218 // layers for other images by substituting "trainingImage" in a Map.addLayer
219 // line with the variable storing the desired image.
220 Map.setCenter(-117.3052, 46.5685, 8);
221 Map.addLayer(trainingImage, {bands: ['B4', 'B3', 'B2'], max: 0.5, gamma: 2},
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
222     'Sentinel true color Late 2018 training image', false);
223     Map.addLayer(trainingImage, {bands: ['B8', 'B4', 'B3'], max: 0.5, gamma: 2},
224     'Sentinel color infrared Late 2018 training image', false);
225     Map.addLayer(ndvi_train, indexParam,
226     'NDVI in image sampled for training', false);
227     Map.addLayer(ndre_train, indexParam,
228     'NDRE in image sampled for training', false);
229     Map.addLayer(ndvi_classify, indexParam,
230     'NDVI in image to classify', false);
231     Map.addLayer(ndre_classify, indexParam,
232     'NDRE in image to classify', false);
233
234
235     /***Create multiband rasters to create customized image composites for training
236     // and classification. Here we selected two bands and two vegetation indices
237     // to use for classification. The remote sensing literature can provide
238     // guidance on the best inputs to use for a given study.
239
240     /*Assign variables for each spectral band of interest and concatenate with
241     // spectral indices into a single multiband image for training and
242     // classification, respectively.
243     var B4_train = trainingImage.select('B4');
244     var B11_train = trainingImage.select('B11');
245     var bandsTraining = ee.Image.cat(
246     [B4_train, B11_train, ndvi_train, ndre_train]);
247     print('bands in training image: ', bandsTraining);
248     //comment out "print" line above after checking image bands
249
250     var B4_classify = classifyImage.select('B4');
251     var B11_classify = classifyImage.select('B11');
252     var bandsClassify = ee.Image.cat(
253     [B4_classify, B11_classify, ndvi_classify, ndre_classify]);
254     print('bands in image to be classified: ', bandsClassify);
255     //comment out "print" line above after checking image bands
256
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

257 Pause here. Copy and paste the lines above into the Code Editor. Save the script and click Run. In the Console, you  
258 will see information about the spectral bands or indices that are included in the images to be used for training and  
259 classification. This is one way to check that the code has run successfully thus far. (See example in image below.)  
260 Once you have viewed the information, you can choose to comment out these “print” lines to save memory on  
261 subsequent runs.

262  
263 The next section goes through a script that executes the land cover classification in the accompanying article (Stahl et  
264 al. in review). Before these code lines can be used, one or more datasets is needed for model training and validation.  
265 These input data can be generated from existing field data or spatial datasets related to land cover that are available  
266 for the area to be used for model training. In this case, we used visual inspection and local knowledge of the study  
267 area to hand-draw polygons representing each cover class. To do this, we referred to Google Earth imagery, NAIP  
268 (National Agricultural Imagery Program, US Department of Agriculture) aerial imagery, and Sentinel-2 satellite  
269 imagery. Through visual interpretation, we identified areas as open water, impervious surfaces, green vegetation, or  
270 brown vegetation (including bare soil). The training polygons from this study are available as a zipped shapefile in the  
271 Github repository. You can import that shapefile into this script, import your own file with reference data or draw and  
272 label your own polygons in the map pane.

273  
274 \*\*\*NOTE: you will not be able to run the remaining lines in this script until you have assigned one of these reference  
275 data sets (for the area you are analyzing) to the variable 'polygons'. If you do try to run without that step, you will  
276 receive an error message, such as "'polygons' is not defined in this scope."\*\*\*  
277

```
278 //***Image classification (into 4 land cover classes: open water, impervious
279 // surfaces, green vegetation, brown vegetation or bare soil)
280
281 // Use these bands for prediction. (These bands should have matching names and
282 // order to the concatenated images created above.)
283 var bands = ['B4', 'B11', 'NDVI', 'NDRE'];
```

```
284
285
286 // *Make a FeatureCollection from the hand-made geometries and assign it to a
287 // variable ("polygons"). (Here, we assigned a value of 0 to both "Other"
288 // (impervious surfaces) and "OpenWater" because they were not the focus of
289 // our analysis. One could designate a separate class for open water by
290 // coding it differently than "Other")
291
292 // *Note: to run the remaining lines in this script, one would
293 // either draw polygons in the map viewer and label them by cover class
294 // (GreenVeg, BrownVeg, etc.) or ingest and import the shapefile of training
295 // polygons from github, then assign it to the variable "polygons" and
296 // delete the line of code below.
297 // If using hand-drawn polygons, remove comment marks to run the line below.
298 //var polygons = ee.FeatureCollection([
299 // ee.Feature(Other, {'class': 0}),
300 // ee.Feature(OpenWater, {'class': 0}),
301 // ee.Feature(BrownVeg, {'class': 1}),
302 // ee.Feature(GreenVeg, {'class': 2}),
303 // ]);
304
305
306 // *Get the values for all pixels in each polygon in the training.
307 var training = bandsTraining.sampleRegions({
308 // Get the sample from the polygons FeatureCollection.
309 collection: polygons,
310 // Keep this list of properties from the polygons.
311 properties: ['class'],
312 // Set the scale to get Sentinel pixels in the polygons. (Adjust the scale
313 // according to the spatial resolution of input imagery.)
314 scale: 10
315 });
316
317 // *Create a random forest classifier with 10 trees.
318 var classifier = ee.Classifier.smileRandomForest(100);
319
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
320 // *Train the classifier.
321 var trained = classifier.train(training, 'class', bands);
322
323
324 // *Classify the composite images. To use only minimum memory needed per run of
325 // the script, we recommend completing only one image classification per
326 // script run. One can then export the classified image to Assets (using
327 // Export line below) and subsequently import it into this or another script
328 // as needed. The completed classification line should then be commented
329 // out, deleted, or updated with a new image to classify.
330
331 // uncomment the line of code that follows to classify the composite image
332 // "bandsTraining" that was sampled for training (assuming that only
333 // selected portions of this image, e.g., the areas within hand-drawn
334 // polygons, were sampled for training)
335 // var trainingClassified = bandsTraining.classify(trained);
336 // remove "/" before "var" in line above to classify the training image
337
338
339 // uncomment the line below to classify the composite image "bandsClassify",
340 // note that you will see an error message saying "imageClassified is not
341 // defined in this scope as long as the line below is commented out.
342 // The classifier cannot be used until a set of training polygons has
343 // been either imported or hand-drawn in the Code Editor.
344 //var imageClassified = bandsClassify.classify(trained);
345 // Display classification results.
346 // Set visualization parameters for the classified images.
347 var ClassParam = {min: 0, max: 2, palette: ["373e8d","ffc772","20b82c"],
348                 opacity: 0.6};
349
350 // Remove comment marks from lines below as needed to display classification
351 // results for current script run.
352 //Map.addLayer(trainingClassified, ClassParam, 'training image classified', false);
353 //Map.addLayer(imageClassified, ClassParam, 'Late 2019 image classified', false);
354
```

To minimize processing time and to avoid going over memory limits per script run, we recommend iterating through classifications and exporting each classified image to Assets. The lines below can be used to export the image that was classified in the current script run. The Tasks pane will show the 'description' indicated in the Export function. Click RUN and a dialog box will open. There you can specify where you wish to send the exported image--to your Earth Engine Assets for use in the Code Editor, or to your Google Drive as a TIFF for download.

```
355 //***Export classified image***
356 // Set image: current image to export, update description)--> choose option to
357 // save as an Earth Engine Asset or TIFF in Google Drive. To follow
358 // subsequent steps in this script, save classified images to your Assets.
359
360
361
362
363
364
365
366     Export.image.toDrive({
367         image: imageClassified,    //if this throws an error, check that
368                                     // the line creating imageClassified is uncommented
369         description: 'Late19classified_100trees', //enter name
370         scale: 10,                  //adjust as appropriate
371         maxPixels: 1e9,             // adjust if needed
372         region: ROI
373     });
374
375 // After each classified image has been exported to Assets, it can be imported
376 // and displayed for subsequent analysis (remove // before "Map" for each
377 // corresponding classified image after import). In the accompanying article,
378 // we classified four images and exported each to Assets, then imported into
379 // this script. We assigned each image to a variable, such that "class16" is
380 // the classified image composite from late summer 2016, and so on.
381 //Map.addLayer(class16, ClassParam, '2016 classification--imported Asset');
382 //Map.addLayer(class17, ClassParam, '2017 classification--imported Asset');
383 //Map.addLayer(class18, ClassParam, '2018 classification--imported Asset');
384 //Map.addLayer(class19, ClassParam, '2019 classification--imported Asset');
385 //Map.addLayer(polygons, {}, 'training polygons'); //uncomment this line to
386 //show the training polygon outlines in the map display when the script is run.
387
388
389 //***Evaluating Accuracy***
390 // FeatureCollection to evaluate classification accuracy. First, create
391 // hand-drawn polygons using Google Earth, Sentinel, or other
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
392 // higher-resolution imagery if available. (For this approach, the total
393 // number of validation pixels must be less than 5000.) Here the polygons
394 // were labeled EvalNonVeg, EvalBrownVeg, or EvalGreenVeg and assigned values
395 // corresponding to the classification above. (A shapefile containing
396 // example validation polygons from the 2019 classified image is available
397 // on GitHub).
398 // If using hand-drawn polygons, remove comment marks to run the line below.
399 // var polyEval = ee.FeatureCollection([
400 //   ee.Feature(EvalNonVeg, {'vclass': 0}),
401 //   ee.Feature(EvalBrownVeg, {'vclass': 1}),
402 //   ee.Feature(EvalGreenVeg, {'vclass': 2}),
403 // ]);
404
405 // Sample specified classification results (class 16, class17, class18 or
406 // class19 to validation areas (not to exceed 5000 pixels).
407 var validation = class19.sampleRegions({
408   collection: polyEval,
409   properties: ['vclass'],
410   scale: 10,
411 });
412
413
414 //Compare the cover class of validation data against the classification result.
415 var testAccuracy = validation.errorMatrix('vclass', 'classification');
416
417 //Print the error matrix to the console (uncomment line below to run)
418 //print('Validation error matrix: ', testAccuracy);
419
420 //Print the overall accuracy to the console (uncomment line below to run)
421 //print('Validation overall accuracy: ', testAccuracy.accuracy());
422
423
424 /***Additional information***/
425 // Additional information can be extracted from the objects created in the
426 // Code Editor. For example, to calculate the area of the training polygons
427 // in square meters:
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
428 // First, create an "image" of pixels with area in m^2
429 var img = ee.Image.pixelArea().clip(polygons);
430
431 // then use reducer to compute sum of areas in polygons.
432 var area2 = img.reduceRegion({
433   reducer: ee.Reducer.sum(),
434   geometry: polygons,
435   scale: 10, // adjust as appropriate
436   maxPixels: 1E13 //adjust if needed
437 });
438
439 // Display the results. (Remove comment marks before in the line of code
440 // below to display the area value.
441 //print('area of training polygons: ', ee.Number(area2.get('area'))
442 //      .getInfo() + ' m2');
443
444 //print('area of training polygons: ', ee.Number(area2.get('area')).getInfo() + '
445 //      m2');
446 // remove comment marks before "print" in line above to display this area
447 // value
448
449
```

#### **Script 2: Create change classes from images that were classified in Script 1**

**Note: This script will not work unless there are already classified images to import (see Script 1 or import classified images from another source).**

```
455 //This is the Classification/Uncertainty script that was used to create
456 // Figure 3e,f in Stahl et al. (2021).
457
458 // *** The purpose of this script is to generate uncertainty classes by querying
459 // 2016-2019 composite images classified by a classifier trained on a 2018
460 // image composite. It then computes area-based statistics for the uncertainty
461 // classes.
462
463 // Before running this script, one must import classified images for each year
464 // from Assets, here each is assigned to a variable named "class19",
465 // "class18", and so on. We also imported a shapefile of the study area
```

Scripts and documentation with updates hosted on GitHub: <https://github.com/ATStahl/CBEM>

```
466 // (HUC8_outline_SHP) and a georeferenced TIFF file indicating riparian
467 // areas (FP1_Rip_FFA1_Mask1). See example list of imports in image below.
468
469
470 // Imports (6 entries)
471 ▶ var class16: Image users/atstahl/Late16classified_100trees (1 band)
472 ▶ var class17: Image users/atstahl/Late17classified_100trees (1 band)
